

90° ANYWHERE

Connecting MAS 90<sup>®</sup> and MAS 200<sup>®</sup> to the world

Sales • Warehouse • Time

## goANYWHERE Overview

goANYWHERE is the wireless mobile solution for MAS 90 and MAS 200 users. goANYWHERE delivers the functionality of MAS 90 Sales Order, Purchase Order, and Inventory to your notebook, tablet, handheld PC, or Smartphone using Microsoft Windows or Microsoft Pocket PC operating systems.

By removing the tie to a network cable, and taking advantage of today's Wi-Fi (wireless fidelity) or cellular technology, your staff can be productive from any location, whether in the office, around the warehouse, or across the country.

goANYWHERE currently consists of three applets—**goSALES**, **goWAREHOUSE**, and **goTIME**.

goSALES delivers MAS 90 sales order entry to your mobile device, enabling your remote users to create new orders and inquire into existing orders.

goWAREHOUSE brings MAS 90 Inventory Transactions, Physical Count, Purchase Order Receiving, and Sales Order Shipping Data Entry functionality to your mobile device, enabling warehouse personnel to use a handheld device whether the warehouse is local or remote. From loading dock to back-office, your staff can perform stock queries, transfers, receipts, issues, adjustments, shipments, and physical counts all without the tie to a wire-locked PC.

goTIME enables your consultants and technicians to record time quickly and easily, from anywhere they have an Internet connection. The time they enter is instantly available to your TimeKeeper for MAS 90 database.

## How goANYWHERE Works

Wi-Fi is a wireless technology like a cell phone. Wi-Fi enabled computers send and receive data indoors and out—anywhere within the range of a base station. The best part of Wi-Fi is speed. It's fast—several times faster than the fastest cable modem connection.

goANYWHERE uses wireless technology in conjunction with virtually any computing device to connect to any IP-based network: the Internet, corporate LAN/WAN, wireless LAN (IEEE 802.11), or cellular wireless networks.

AlwaysOn functionality with real-time data exchange is the key benefit. With goAnywhere there is no "dock and dump"—you are connected, anytime and anywhere.

For those inevitable times when no network connection

is available, goANYWHERE runs in an AlwaysOn mode, synchronizing data once a connection exists.

## Wi-Fi Is Here—And It's Accessible

Wireless is all around you. Hotels, airport lounges, coffee shops, and restaurants now have Wi-Fi Zones, assuring you high-speed, high quality Internet access at hundreds of locations. Soon, Wi-Fi networks will be found in every major urban area, providing coverage throughout the central city, or even lining major highways.

Wireless LANs are no longer a technology reserved for large companies with mile high budgets. Advances and innovations have put this technology within reach of middle market companies, like yours.

The advantages of wireless for MAS 90 users are enormous. The length of your PC cable no longer limits your access to your information system. Armed with a notebook, tablet, handheld PC, or a Smartphone, you can run many MAS 90 functions anywhere.

## Work When You're Connected Work When You're Not

Capitalizing on the AlwaysOn technology, goANYWHERE senses a network connection and runs in a live mode, writing transactions directly to the MAS 90 data files. When a connection is unavailable, transactions are collected and stored in your computing device. Once a connection is established, the simple synchronization program uploads the transactions.

## Remote Sales Entry goSALES For MAS 90 And MAS 200

goSALES for MAS 90 transforms the sales process by providing sales order entry functionality when and where you need it. With goSALES, users can enter new sales orders or interact with existing sales orders using virtually any computing device connected to any IP-based network, such as the Inter-

net or corporate LAN/WAN, and even through your cellular phone network.

goSALES allows remote and wireless users to access the centralized MAS 90 sales order database through a secure and familiar Windows-style interface running on your laptop, PDA, Web browser, or other computing device. goSales is a cost-effective solution for extending order entry capabilities to users regardless of their physical location.

## goSALES At Work

A sales representative carries a small notebook computer or PDA while performing daily delivery rounds and prospect visits. At each customer site, a new sales order is created, and each item ordered or sold is entered into the order. Special instructions in the comment field are entered, ensuring each order is processed accurately. MAS 90 goSales allows your mobile sales reps to enter and submit orders via a secure, real-time connection. What may have been non-productive time is now put to productive use. Waiting for a flight, on the showroom floor, at a restaurant for lunch, or in their home office, your sales reps can enter orders and check order status.

## goSALES is AlwaysOn

Capitalizing on the AlwaysOn technology, goSALES allows users to take orders anytime, anywhere. Using a secure connection, a user may enter and submit orders real-time. If a connection is unavailable, orders can still be entered and are stored on the computing device. When a connection is established, the orders are easily uploaded. goSALES provides mobile representatives with the ability to take orders anytime without interruption.

## Remote Time Entry goTIME—Time Collection That Goes Anywhere

Your consulting staff is on the road, visiting clients and accumulating billable and nonbillable time. How do these employees track their hours to ensure clients get billed? In a spreadsheet handed to accounting? In an email sent to the boss? With a phone call to admin?

goTIME puts the responsibility of time entry in the hands of those who know their time best—the employees. goTime provides streamlined project billing time entry, anywhere there is Internet access. Wherever your employees travel, goTime gives them the tools they need to maintain a precise and complete accounting of their time. With this simple, effective way to track their time, employees can work more efficiently and improve productivity. Your company benefits by having less overhead and a faster billing cycle.

Your employees simply log on to a secure Web site, enter their time in a convenient weekly grid, referencing the clients, projects, and activities corresponding to their work. The data they enter is instantly available within the Timekeeper MAS 200 database. No double entry, no administrative overhead, and no imports. The single time entry created in Timekeeper serves both as the basis for billing clients and for creating payroll entries.

Consultants, attorneys, field service, architects, advertising agencies, and temporary employment agencies—any business that wants to efficiently and effectively collect hours for payroll generation and client billing will benefit from goTime.

## Warehouse Automation goWAREHOUSE For MAS 90 And MAS 200

goWAREHOUSE frees your warehouse personnel from the cabled PC. Inventory transactions, purchase order receipts, physical counts, and shipping data entry are all performed at the point of interaction, wherever that might be.

With goWAREHOUSE, users can receive goods, record shipments, capture cycle count data, and perform Shipping data entry for pick, pack and ship functions.

goWAREHOUSE allows wireless users to access the centralized MAS 90 database using virtually any computing device and your corporate wireless network.

## goWAREHOUSE At Work

A large shipment arrives at the loading dock. Your receiving clerk rapidly scans the bar coded item number on each package, noting the quantity received. Packages without a bar coded label will get one before they ever leave the loading dock—courtesy of the wireless print server mounted nearby. In contrast to 'dock and dump' systems, goWAREHOUSE is communicating directly with your MAS 90 database. Item numbers and warehouse codes entered are validated, and quantities received are instantly available to the sales staff.

## Wireless LANs Ideal For Warehouse Environments

Rather than returning to a cabled computer to record transactions, using wireless technology, your computer travels with you. Running network cable to the far reaches of your warehouse is expensive, and still employees must perform their tasks at the workstation, rather than at the point of interaction. With goWarehouse and an inexpensive wireless network, you can place a workstation or carry a hand-held device anywhere in the warehouse, without need for expensive cabling.

As your business grows, you will find it's easy to add another wireless device or portable computer to your network. There's no need to purchase or lay more cable or find an available Ethernet port on your hub or router. Should you move to a larger location, you don't have to abandon your network infrastructure investment or hire a networking company to rewire the new location.

## General Specifications

Server	MAS 90 or MAS 200 version 3.71 or higher
Client	Windows 98/ME/2000/XP Internet Explorer 5.0 or higher
PDA	HP iPaq 2215 Pocket PC 2003
